## Dataset

Drag and drop your .csv file here

OR

[Browse Files](#)

**Note:** Your .csv must contain demographic features (e.g., Race, Gender) and a binary target variable to enable bias auditing.

## Data Pipeline Scripts

Drag and drop your preprocessing scripts here

OR

[Browse Files](#)

Supported format: .py only

**Note:** Drag scripts to set execution order. For the auditor to track provenance, you must put the `@tracker.track("[Function's Task]")` above any function that modifies the dataframe.

⋮ handle\_missing\_data.py

⋮ remove\_duplicates.py

## Select and Configure Protected Demographic Attributes

Select column/s from dataset

Column/s Selected

X Race

Categorical

Continuous

X Sex

Categorical

Continuous

X Age

Categorical

Continuous

 This establishes the core demographic variables that the system will monitor and allows the system to analyze combinations of characteristics to expose the highest bias.

## Define the Binary Target Variable and its Outcome Values

Select binary target column from the dataset

Income

Select favorable outcome value

> 50,000

Select unfavorable outcome value

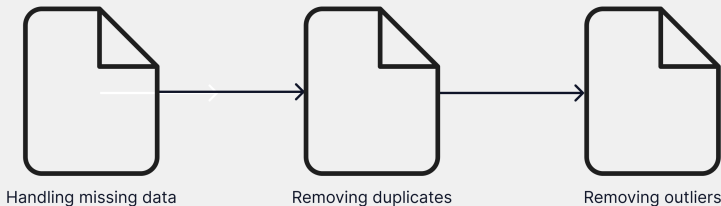

<= 50,000

 Defining outcome values is required to compute selection rates for mathematical bias calculation.

## BIAS AUDIT REPORT AND FEEDBACK

Audit ID: AUD-20260522-001

### TRACEABILITY LINEAGE

**Transformation:** Handle Missing Values

**Script Name:** handle\_missing\_data.py

**Timestamp:** 2026-05-22T21:53:26.416077

**Row Count:** Before: 32559 | After: 32559

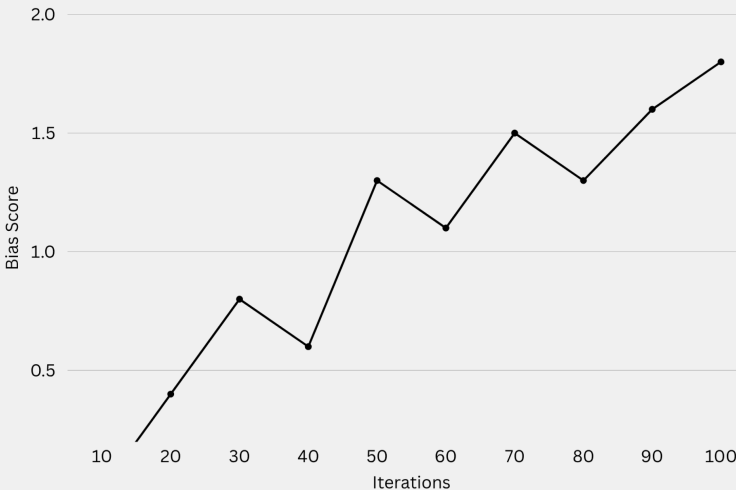

**Highest Bias Group:**

**Race:** White | **Sex:** Male | **Age:** >50

**Bias Score:** 1.79

**RECOMMENDED ACTIONS:**

1. Implement Group-Stratified Imputation locally within the script.
2. Check the raw entry distribution for data collection drops prior to processing.
